Introduction to Parallel Programming - cac.cornell.edu

The primary intent of parallel programming is to decrease execution wall clock time, however in order to accomplish this, more CPU time is required. For example, a parallel code that runs in 1 hour on 8 processors actually uses 8 hours of CPU time.

Introduction to Parallel Computing

Depending on the application, two common approaches in parallel programming are either to run code via threads or multiple processes, respectively. If we submit "jobs" to different threads, those jobs can be pictured as "sub-tasks" of a single process and those threads will usually have access to the same memory areas (i.e., shared memory).
