THE ORACLE OF STAMBOUL is a magical historical novel about an astonishing eight-year-old girl in the last days of the Ottoman Empire. It is 1877, on the shores of the Black Sea, and the omens for the newborn Eleanora Cohen are hardly promising. Not only does her mother die in childbirth, but her village is being attacked by the Tsar's Royal Cavalry. However, despite this bad beginning, a sour stepmother and a traumatic journey in the hold of a ship, young Eleanora grows into a remarkably clever but very engaging child. And when a heartbreaking tragedy leaves her marooned in Istanbul, where spies and boarded-up harems and sudden death are as much a part of life as delicious spices, Paris fashions and rosewater, it is Eleanora's extraordinary courage and character which lead her straight to the Sultan's court, and to her salvation.

Climate and Environmental Database Systems contains the papers presented at the Second International Workshop on Climate and Environmental Database Systems, held November 21-23, 1995, in Hamburg, Germany. Climate and environmental data may be separated into two classes, large amounts of well structured data and smaller amounts of less structured data. The large amounts are produced by numerical climate models and by satellites, handling data in the order of magnitude of 100 Tbytes for the climate modelling sites and 1000 Tbytes for the recording and processing of satellite data. Smaller amounts of poorly structured data are the environmental data, which come mainly from observations and measurements. Present-day problems in data management are connected with a variety of data types. Climate and Environmental Database Systems addresses the state of the art, practical experience, and future perspectives for climate and environmental database systems, and may be used as a text for a graduate level course on the subject or as a reference for researchers or practitioners in industry.
