Japanese Foreign Investments, 1970-1998

A key topic of many technical discussions has been the development of alternative fuels to power the compression ignition engine. Reasons for this include the desire to reduce the dependency on petroleum-based fuel and, at the same time, to reduce the particulate matter (PM) and NOx emissions. Also, there has been interest generated in the diesel engine because of the reduction in greenhouse gases that has been proposed during the 2008-2012 time frame in Europe and the regulations that affect diesel engines in the United States.

Riding with seat aids - the science behind an almost forgotten art

Proceedings of the Power Conversion Conference

Plunkett's Automobile Industry Almanac 2009

Riding with seat aids is based on two principles - the mutual transmission of body oscillations between horse and rider and the mutual, mostly subconscious perception of the body. Accordingly, riding with seat aids is traditionally also learned subconsciously, preferably in childhood by practicing on a horse acting as a teacher. Modern science, however, can explain how it works to ride with seat aids only. Whoever understands the biomechanics of the body oscillations of horse and rider can become aware of the communication via body perception and thus also consciously learn to ride in movement symbiosis with the horse.
