Default Routes in Cisco

Routers Explained

Routers support interface virtualization. We can use a single router interface to allow communication between multiple VLANs. To virtualize the Fa0/0 interface and to configure it to allow communication between different VLANs, use the

Page 150/152

following configuration
on the router.

```
Router (config)# ipv6  
route ::/0 serial 0/0/0.
```

The following
command configures
an IPv6 default route
that forwards all
packets to the next-
hop 2001:DB8:1:F::1.

```
Router (config)# ipv6
```

route ::/0
2001:DB8:1:F::1. To
view the default route
configuration, use the
"show ip route"
command from the
privileged-exec
mode.
