Computer Architecture From Microprocessors To Supercomputers Solutions

Some microprocessors include a small hardware stack built into the CPU, independent from the rest of the RAM. Some people claim that a processor must have a hardware stack in order to run C programs. Most computer architectures have hardware support for a recursive "call" instruction in their Assembly Language.

A microprocessor is a computer processor that incorporates the functions of a central processing unit on a single (or more) integrated circuit (IC) of MOSFET construction. The microprocessor is a multipurpose, clock driven, register based, digital integrated circuit that accepts binary data as input, processes it according to instructions stored in its memory and provides results (also in ...
