In the years since it first published, *Neuroeconomics: Decision Making and the Brain* has become the standard reference and textbook in the burgeoning field of neuroeconomics. The second

Page 2/46

edition, a nearly complete revision of this landmark book, will set a new standard. This new edition features five sections designed to serve as both classroom-friendly introductions to each of the major subareas in

neuroeconomics, and as advanced synopses of all that has been accomplished in the last two decades in this rapidly expanding academic discipline. The first of these sections provides useful introductions to

the disciplines of
microeconomics, the psychology
of judgment and decision,
computational neuroscience, and
anthropology for scholars and
students seeking interdisciplinary
breadth. The second section

Page 5/46

provides an overview of how human and animal preferences are represented in the mammalian nervous systems. Chapters on risk, time preferences, social preferences, emotion, pharmacology, and

Page 6/46

common neural currencies—each written by leading experts—lay out the foundations of neuroeconomic thought. The third section contains both overview and in-depth chapters on the fundamentals of

Page 7/46

reinforcement learning, value learning, and value representation. The fourth section, “The Neural Mechanisms for Choice,” integrates what is known about the decision-making architecture

Page 8/46

into state-of-the-art models of how we make choices. The final section embeds these mechanisms in a larger social context, showing how these mechanisms function during social decision-making in both

humans and animals. The book provides a historically rich exposition in each of its chapters and emphasizes both the accomplishments and the controversies in the field. A clear explanatory style and a single

expository voice characterize all chapters, making core issues in economics, psychology, and neuroscience accessible to scholars from all disciplines. The volume is essential reading for anyone interested in

neuroeconomics in particular or decision making in general. Editors and contributing authors are among the acknowledged experts and founders in the field, making this the authoritative reference for neuroeconomics

Subjective Well-Being and Life
Satisfaction

Well-Being Therapy (WBT) is the
psychotherapeutic approach developed by
Giovanni Fava, a world-renowned

psychiatrist and psychotherapist, and the editor-in-chief of Psychotherapy and Psychosomatics. WBT is an innovative strategy that is based on monitoring psychological well-being, whereby the patient progressively learns how to make it grow. This type of therapy has enjoyed much success and is increasing in popularity

around the world. The first part of this long-awaited book describes how the idea for WBT was formed, the first patient treated, and the current evidence that supports this approach. In Part II, Giovanni Fava provides the treatment manual of WBT, describing what each session entails, and includes many examples from his own cases.

Page 18/46

The last part covers some of the specific conditions for which WBT can be used and how sessions can be conducted. It includes sections on depression, mood swings, generalized anxiety disorder, panic and agoraphobia, and posttraumatic stress disorder. There is also information on the application of WBT in interventions in

school settings. Throughout the book, Dr. Fava keeps things interesting by peppering his narrative with anecdotes from his medical career. The primary audience for this book is professionals within psychology, psychiatry, and other fields of medicine (e.g., family practice, pediatrics, and rehabilitation). However, the book is written

in a relaxed, clear, and accessible style that also makes it of interest to counselors, educators, and family and friends of patients, not to mention patients themselves.

Well-Being Therapy

Anyone who claims the right ‘ to choose how to live their life ’ excludes any purely

Page 21/46

deterministic description of their brain in terms of genes, chemicals or environmental influences. For example, when an author of a text expresses his thoughts, he assumes that, in typing the text, he governs

the firing of the neurons in his brain and the movement of his fingers through the exercise of his own free will: what he writes is not completely pre-determined at the beginning of the universe. Yet in the field of

neuroscience today,
determinism dominates. There
is a conflict between the daily
life conviction that a human
being has free will, and
deterministic neuroscience.
When faced with this conflict

two alternative positions are possible: Either human freedom is an illusion, or deterministic neuroscience is not the last word on the brain and will eventually be superseded by a neuroscience that admits

processes not completely determined by the past. This book investigates whether it is possible to have a science in which there is room for human freedom. The book generally concludes that the world and the

brain are governed to some extent by non-material agencies, and limited consciousness does not abolish free will and responsibility. The authors present perspectives coming from different

disciplines (Neuroscience, Quantumphysics and Philosophy) and range from those focusing on the scientific background, to those highlighting rather more a philosophical analysis. However,

all chapters share a common characteristic: they take current scientific observations and data as a basis from which to draw philosophical implications. It is these features that make this volume unique, an exceptional

interdisciplinary approach
combining scientific strength
and philosophical profundity. We
are convinced that it will
strongly stimulate the debate
and contribute to new insights
in the mind-brain relationship.

The Cognitive-Emotional Brain
The quality of people's
relationships with and interactions
with other people are major
influences on their feelings of well-
being and their evaluations of life
satisfaction. The goal of this volume

Page 31/46

is to offer scholarly summaries of theory and research on topics at the frontier of the study of these social psychological influences—both interpersonal and intrapersonal—on subjective well-being and life satisfaction. The chapters cover a

variety of types of relationships (e.g., romantic relationships, friendships, online relationships) as well as a variety of types of interactions with others (e.g., forgiveness, gratitude, helping behavior, self-presentation). Also

included are chapters on broader social issues such as materialism, sexual identity and orientation, aging, spirituality, and meaning in life. Subjective Well-Being and Life Satisfaction provides a rich and focused resource for graduate

students, upper-level undergraduate students, and researchers in positive psychology and social psychology, as well as social neuroscientists, mental health researchers, clinical and counselling psychologists, and anyone interested in the science of

well-being.

Is Science Compatible with Free Will?

A study that goes beyond the debate over functional specialization to describe the ways that emotion and

cognition interact and are integrated in the brain. The idea that a specific brain circuit constitutes the emotional brain (and its corollary, that cognition resides elsewhere) shaped thinking about emotion and

the brain for many years.
Recent behavioral,
neuropsychological,
neuroanatomy, and
neuroimaging research,
however, suggests that
emotion interacts with
cognition in the brain. In

this book, Luiz Pessoa moves beyond the debate over functional specialization, describing the many ways that emotion and cognition interact and are integrated in the brain. The amygdala is often viewed as the

quintessential emotional region of the brain, but Pessoa reviews findings revealing that many of its functions contribute to attention and decision making, critical components of cognitive functions. He

Page 40/46

counters the idea of a subcortical pathway to the amygdala for affective visual stimuli with an alternate framework, the multiple waves model. Citing research on reward and motivation, Pessoa also

proposes the dual competition model, which explains emotional and motivational processing in terms of their influence on competition processes at both perceptual and executive function levels.

He considers the broader issue of structure-function mappings, and examines anatomical features of several regions often associated with emotional processing, highlighting their connectivity

properties. As new theoretical frameworks of distributed processing evolve, Pessoa concludes, a truly dynamic network view of the brain will emerge, in which "emotion" and "cognition" may be used as

labels in the context of certain behaviors, but will not map cleanly into compartmentalized pieces of the brain.
