Treatment and outcome of spinal dural arteriovenous fistulas

Introduction. Spinal
vascular
malformations are
rare and often
misdiagnosed
entities. In principle,
we distinguish
between three types

Page 2/111

of spinal vascular malformation: extradural, dural, and intradural [2, 6, 7, 11, 12]. The intradural malformations can be separated into perimedullary fistulas and the real intramedullary arteriovenous malformations

Page 3/111

(AVMs).

Dural arteriovenous fistula This dural arteriovenous fistula of the superior sagittal sinus drains into subarachnoid veins and is classified as Borden type IIIb. A dural arteriovenous fistula (DAVF) or Malformation, is an

Page 4/111

abnormal direct connection (fistula) between a meningeal artery and a meningeal vein or dural venous sinus . Arteriovenous malformation is an abnormal connection between arteries and veins, bypassing the capillary system. This

Page 5/111

vascular anomaly is widely known because of its occurrence in the central nervous system (usually cerebral AVM), but can appear in any location. Although many AVMs are asymptomatic, they can cause intense
