EMI consists of disruptive electromagnetic energy that transmits from one device to another or from one piece of equipment to another. As we work with electronic system, we apply the principles of electromagnetic compatibility and look for areas that seem vulnerable to EMI. Cellphones, welders, motors, and other equipment generate EMI.

Successful adaptation
requires competency,
skills, and expertise in
both safety engineering
and real-life EMI (not
just EMC testing).
Devices can fail at two
or more pins
simultaneously. EMI can

cause two or more pins on a semiconductor device, such as an integrated circuit (IC), to change state simultaneously.
