policy both in terms of preventive planning and in control (10). This was not an only case and recent studies of the spread of Ebola (in Africa in 2014) and Zika (in South America in 2015) have demonstrated further precisely why the study of instances of diseases, illness and other conditions is just as important as treatment.

Environmental epidemiology has, in fact, experienced somewhat of a renaissance during the past 20 years, as public concerns and academic interests have grown regarding the potential health consequences of air, water, soil, and food contaminants, as well as those related to environmental conditions that occur on a global

scale, notably climate change.
