Epidermolysis bullosa (EB) encompasses a clinically and genetically heterogeneous group of rare inherited disorders characterized by marked mechanical fragility of epithelial tissues with blistering,

erosions, and nonhealing ulcers following minor trauma.

#### REFERENCES - Evidence-Based Clinical Decision Support at ...

Epidermolysis bullosa (EB) is a genetic skin disorder characterized clinically by blister formation from mechanical trauma. There are four main types with additional sub-types identified. There is a spectrum of severity, and within each type, one may be either mildly or severely affected.

#### Epidermolysis Bullosa - NORD (National Organization for ...

#### Epidermolysis Bullosa: Clinical, Epidemiologic and ...

Epidermolysis bullosa acquisita (EBA) is an autoimmune subepidermal bullous disorder of the skin and mucous membranes. The disease results from the production of immunoglobulin G (IgG) antibodies against type-VII collagen, a major component of anchoring filaments in the dermal-epithelial junction.

#### Epidermolysis Bullosa Acquisita: A Case Report of a Rare ...

Abstract Background: Epidermolysis bullosa (EB) is a rare and so far incurable genetic disease, affecting mainly the skin and mucosal membranes, manifesting with blisters triggered by minor mechanical trauma. Since only few epidemiological data on EB are available, we established a Registry for EB and implemented molecular diagnostic methods.

#### Epidemiology of inherited epidermolysis bullosa in Romania ...

Epidemiology The incidence and prevalence of inherited EB in the US are approximately 19.6 per 1 million live births and 8.2 per 1 million, respectively, based on data from the National EB Registry.
