FLUID FLOW AND HEAT TRANSFER OF AN IMPINGING AIR JET

The heat transfer coefficient is the reciprocal of thermal insulance. This is used for building materials and for clothing insulation. There are numerous methods for calculating the heat transfer coefficient in different heat transfer modes, different fluids, flow regimes, and under different thermohydraulic conditions.

The fluid flow and heat transfer performance of a wavy microchannel is studied, for the sake of illustrating the feasibility and effectiveness of the present idea. The wavy microchannel consists of 10 wavy units, with the four units in the middle being identical to the wavy units in the previous Section 3.1, with $\theta = 0.075$. The first three units of the channel are identical to each other and their wavelength has been increased by 25% over that of the four units in the middle.
