and future challenges in the design of next generation Grid systems. The seminar brought together 45 scientists and researchers in the area of Grid technologies in an attempt to draw a clearer picture of future generation Grids and to identify some of the most challenging problems on the way to achieving the "invisible" Grid ideas in our society.

OPUS 4 | On Adaptability in Grid Systems

To achieve the maximum benefit from new digital technologies, grid operators will need to plan future

investments carefully to avoid the risk of stranded assets. Forward-thinking companies should draw up an integrated grid plan, mapping out the potential capex requirements for their investments, smart-grid devices, and future platform developments.

The Power Grid of the Future

Grid generation codes represent an indispensable tool for solving field problems in nearly all areas of applied mathematics. The use of these grid codes significantly enhances the productivity and reliability of the numerical analysis of problems with complex geometry and complicated solutions. The science of grid generation is rather young and is still growing fast; new developments are ...

Grid Generation Methods - Vladimir D. Liseikin - Google Books

Mesh generation is the practice of creating a mesh, a subdivision of a continuous geometric space into discrete geometric and topological cells. Often these cells form a simplicial complex. Usually the cells partition the geometric input domain. Mesh cells are used as discrete local approximations of the larger domain.

Future Generation Grids Proceedings of the Workshop on Future Generation Grids

November 1 – 5, 2004, Dagstuhl, Germany

Mesh generation is the practice of creating a mesh, a subdivision of a continuous geometric space into discrete geometric and topological cells. Often these cells form a simplicial complex. Usually the cells partition the geometric input domain. Mesh cells are used as discrete local approximations of the larger domain.

Homogeneous bulk power grid is rapidly evolving into a composition of the old power grid and many loosely coupled local distribution grids and stand-alone micro-grids. Traditional top-down (VERTICAL) planning and dispatching of electric power from central station generators to end-use customers does not leverage DERs and is thus sub-optimal.

To achieve the maximum benefit from new digital technologies, grid operators will need to plan future investments carefully to avoid the risk of stranded assets. Forward-thinking companies should draw up an integrated grid plan, mapping out the potential capex requirements for their investments, smart-grid devices, and future platform developments.
