It introduces a formalism, boundary solid grammars, for this purpose. In this formalism, a set of geometric rules is applied to an initial solid model to generate a language or family of solids. A rule may match on a portion of the boundary of a solid, and then modify the solid or add new solids.

A Design Representation to Support Automated Design Generation

Generative design is a flexible and scalable framework. It can be applied to a wide range of design problems and scales, from industrial components all the way to buildings and cities.

Generative Geometric Design And Boundary

Generative geometric design Abstract: Boundary solid grammars use design rules that express complex geometric conditions and operations using a logical reasoning mechanism, allowing one to construct powerful rules and describe appropriate grammars for the generation of solid models for a variety of design domains.

Generative Shape Design

Design systems that support automated reasoning and design generation demand more from design representations than traditional CAD systems. Those representations must capture aspects of the design, ranging from abstract, high-level specifications of design constraints to detailed descriptions of design geometry.

A Design Representation to Support Automated Design Generation

In generative, constraint-based design, users graphically se- lect shape elements of design instances in order to specify shape operations that have generic intent. We discuss tech- niques for naming algorithmically and generically the identi- fied geometric instance, and report on our experience with
