Guide To 3d Vision Computation

Unlike other textbooks on computer vision, this Guide to 3D Vision Computation takes a unique approach in which the initial focus is on practical application and the procedures necessary to actually build a computer vision system. The theoretical background is then briefly explained afterwards, highlighting how one can quickly and simply obtain the desired result without knowing the derivation of the mathematical detail.

This is an older book that focuses on computer vision in

general with some focus on techniques related to 3D problems in vision. It's a great starting point, intended for undergraduate rather than graduate-level readers. This book is meant to be: [...] an applied introduction to the problems and solutions of modern computer vision.

Finally, binocular stereovision can be used to calculate the 3D coordinates (X,Y,Z) of points on the surface of an object being inspected. These points are often referred to as point clouds or cloud of points. Point clouds are very useful in visualizing the 3D shape of objects and can also be used by other 3D analysis software.
