Handbook of Signal Processing in Acoustics | SpringerLink
Handbook of Neural Network Signal Processing, Boca Raton: CRC Press, <https://doi.org/10.1201/9781315220413>. The use of neural networks is permeating every area of signal processing. They can provide powerful means for solving many problems, especially in nonlinear, real-time, adaptive, and blind signal processing.

The Handbook of Signal Processing in Acoustics presents signal processing as it is practiced in the field of acoustics. The Handbook is organized by areas of acoustics, with recognized leaders coordinating the self-contained chapters of each section. It brings together a wide range of perspectives from over 100 authors to reveal the interdisciplinary nature of signal processing in acoustics.

This new edition of the handbook is organized in three parts. Part I motivates representative applications that drive and apply state-of-the-art methods for design and implementation of signal processing systems; Part II discusses architectures for implementing these applications; and Part III focuses on compilers, as well as models of computation and their associated design tools and methodologies.

Handbook of Signal Processing Systems | SpringerLink
Handbook of Signal Processing in Acoustics. Offers a multidisciplinary look at the signal processing that underpins most of modern acoustics. Provides a wide range of perspectives throughout the field of acoustics with over 100 authors. Focuses on how signal processing is used to deal with problems in acoustics.

of signal processing within acoustics. It is also hoped that the handbook will promote networking and the interchange of ideas between technical areas in acoustics. The handbook comprises 104 Chapters organized into 17 Parts. Each Part addresses a technical area of acoustics, reflecting the general demarcations of specialization within the acoustics community. An expert with broad knowledge of signal processing

Handbook of Signal Processing in Acoustics
The estimation of time delay or time difference has become an important problem in digital signal processing, for example, an ideal active radar or sonar that employs a single omnidirectional sensor to transmit and receive signals can measure the time difference between the time a signal was transmitted and the time a backscattered signal was received to estimate the range of a radar or sonar target.
