Vulcanization is a form of cross-linking wherein a rubber is formed, yet rarely do technologists refer to rubber as a thermoset plastic. Biopolymers (amino acid/protein based) are known to cross-link (one

theory suggests this as a root cause of aging) and we hardly think of animals as thermosetting plastics.

Introduction - ScienceDirect

Curing. Curing a thermosetting resin transforms it into a plastic, or elastomer (rubber) by crosslinking or chain extension through the formation of covalent bonds between individual chains of the polymer.

Crosslink density varies depending on the monomer or prepolymer mix, and the mechanism of crosslinking: Acrylic resins,...
