Organic compounds are ubiquitous in nature. They are present in food, commercial products, domestic materials, and all the cells of the human body. The realization that the chemistry of organic compounds permeates all life forms, often stimulates the desire of many students to pursue studies in medical- and natural-chemistry-related fields. In my own case, although I had always been fascinated by chemistry in general, I only opted to study it at a higher level by default. This is because prior to my university education, I barely understood its various concepts. But this changed dramatically when at university, I was lucky enough to be taught by some very inspirational, experienced and internationally-acclaimed chemistry teachers, who actually lived the subject.

Interestingly, even then, there were only a few relevant, user-friendly textbooks on the subject. As I have discovered over the years, organic chemistry is so broad and covers so much that for effective delivery, not only must those who teach the subject constantly adopt innovative methods of teaching, there must also be readily-available and easy-to-read textbooks. Because of the apparent complexity of the subject, organic chemistry teachers must always aim to instill a love of learning for it, by imparting knowledge in ways that can be motivating and exciting. When students have access to relevant, user-friendly textbooks and lessons are made interactive, simple, clear and exciting, rather than dominated by learning by rote, organic chemistry can be both interesting and easy-to-understand. This book is an attempt to contribute to the growing body of knowledge that aims to stimulate students' interest, and love for the wonderful world of organic chemistry. The intention is to equip students with the basic concepts, so they can refrain from simply memorizing, but rather seek to understand and not be intimidated by it.

Transformations in Urban Education: Urban Teachers and Students Working Collaboratively addresses pressing problems in urban education, contextualized in research in New York City and nearby school districts on the Northeast Coast of the United States. The schools and institutions involved in empirical studies range from elementary through college and include public and private schools, alternative schools for dropouts, and museums. Difference is regarded as a resource for learning and equity issues are examined in terms of race, ethnicity, language proficiency, designation as special education, and gender. The contexts for research on teaching and learning involve science, mathematics, uses of technology, literacy, and writing comic books. A dual focus addresses research on teaching and learning, and learning to teach in urban schools. Collaborative activities addressed explicitly are teachers and students enacting roles of researchers in their own classrooms, cogenerated dialogues as activities to allow teachers and students to learn about one another's cultures and express their perspectives on their experienced realities and negotiate shared recommendations for changes to enacted curricula. Coteaching is also examined as a means of learning to teach, teaching and learning, and undertaking research. The scholarship presented in the constituent chapters is diverse, reflecting multi-logicality within sociocultural frameworks that include cultural sociology, cultural historical activity theory, prosody, sense of place, and hermeneutic phenomenology.

Methodologies employed in the research include narratology, interpretive, reflexive, and authentic inquiry, and multi-level inquiries of video resources combined with interpretive analyses of social artifacts selected from learning environments. This edited volume provides insights into research of places in which social life is enacted as if there were no research being undertaken. The research was intended to improve practice. Teachers and learners, as research participants, were primarily concerned with teaching and learning and, as a consequence, as we learned from research participants were made aware of what we learned—the purpose being to improve learning environments. Accordingly, research designs are contingent on what happens and emergent in that what we learned changed what happened and expanded possibilities to research and learn about transformation through heightening participants' awareness about possibilities for change and developing interventions to improve learning.
