The revolutionary effects of using accounting information systems by displacing manual information systems in the private and public sectors cannot be overstated. The benefits of this substitution of set of processes include increased mathematical accuracy, predefined fields and coding tasks, and de-emphasis of manual clerical labor in favor of labor adept in data processing. Reporting can be significantly automated, facilitating managerial power and control at a distance and the proliferation of global enterprises. The potential detriments are rarely accurately, completely, and timely addressed as information system vendors, management consultants, and corporate procurement teams race toward the popularly conceived state of the art. Systems are ballyhooed as continually improving in processing speed, functionality, and capacity. Users of these automated systems may not consider big picture effects, and they may not intelligently consider the conduct risks to their own enterprises by concentrating such global reach and influence at high levels of senior management without dedicating adequate resources to verifying the accuracy, completeness, and timeliness of the information systems. This book considers these risks.

Applications of Accounting Information Systems

This book, first published in 1988, is a readable, concise history of the accounting profession in the US from its beginnings to the late twentieth century. It examines the roots of the profession, how it developed, how its standards have evolved, and what social, economic and legal forces have shaped it. The chapters form a series of dramatic highlights, illustrative of the multifarious problems besetting a young profession, catapulted into prominence by the economic and social forces of the twentieth century.

The fourth edition of this text addresses the issue of organizational culture in more detail and gives an analysis of why information system projects fail and what can be done to make success more likely.

Introduction to Accounting Information Systems offers an introductory insight into the nature, role and context of accounting information systems. Students will gain an understanding of how companies can integrate technologies into their AIS and how this integration can assist in the management and control of organisational resources and the maximisation of shareholder wealth.

Serving as a general, nontechnical resource for students and academics, these volumes provide an understanding of the development of business as practiced around the world.
