## Limit Theorems For Stochastic Processes

The authors of this Grundlehren volume, two of the international leaders in the field, propose a systematic exposition of convergence in law for stochastic processes, from the point of view of semimartingale theory, with emphasis on results that are useful for mathematical theory and mathematical statistics.

The central limit theorem is now an example of a very wide class of theorems about convergence in distribution of sequences of random variables or sequences of stochastic processes. Equivalently, these theorems deal with the weak convergence of the probability measures describing the distributions of the variables or processes under consideration (cf. Convergence of measures ; Weak convergence of probability measures ).

Week 1.11: Limit theorems for renewal processes - Week 1 ...

In this paper,  $n^{-1/2} (P_n - P)$  is regarded as a stochastic process indexed by a family of square integrable functions. A functional central limit theorem is proved for this process. The statement of this theorem involves a new form of combinatorial entropy, definable for classes of square integrable functions.
