Magnetic resonance imaging (MRI) is a medical imaging technique used in radiology to form pictures of the anatomy and the physiological processes of the body. MRI scanners use strong magnetic fields, magnetic field gradients, and

radio waves to generate images of the organs in the body. MRI does not involve X-rays or the use of ionizing radiation, which distinguishes it from CT and PET scans.

Magnetic resonance and its applications. St. Petersburg, Russia. March 29 — April 3, 2020. Dear Colleagues, With great regret we came to the conclusion that due to the spread of COVID-19 infection the holding of Spinus 2020 Confer?nce in the usual format is now impossible. The number of infected in Russia is low but because of the quarantine measures on the boards no one can guarantee that you can freely enter Russia even if you have the valid Russian visa.

Magnetic resonance (MR) images acquired preoperatively aid in planning the optimal surgical approach to a lesion. Intraoperative MRI provides near real-time images, which enable the surgeon to correct or modify the preplanned trajectory of approach during the actual surgery.
