

Manhole Base Installation Guide

• For the excavation work required prior to manhole construction a mechanical excavator is normally required. The type is dependant on the manhole diameter and weight (see table at foot of page). • For manhole rings up to and including DN1200, a backhoe type excavator with a 1T lift capacity is generally adequate. For larger rings Easi-Base™ addresses a long-standing problem associated with traditional methods of manhole construction. Labour intensive, in-situ practices typically taking up to 36 hours are eliminated by the fully integrated unit which can be installed and connected in a matter of minutes.
