Modeling and Control of Legged Robots Summary Introduction The promise of legged robots over standard wheeled robots is to provide improved mobility over rough terrain. This promise builds on the decoupling between the environment and the main body of the robot that the presence of articulated legs allows, with two consequences.

Modeling, Simulation and Control of Soft Robots with SOFA. With this mechanical model, it becomes possible to compute the position of the robot according to changes on the inputs of the actuators (pressure, current, displacement). We can also simulate the mechanical interaction of the robot with its environment.
