Many of the main uses for matrices in multivariable calculus involve calculating something called the determinant. It's

useful, for example, to calculate the cross product as well as a change of variables. The determinant of a matrix is defined only for square matrices, i.e., $n \times n$ matrices with the same number of rows and columns.

In mathematics, matrix calculus is a specialized notation for doing multivariable calculus, especially over spaces of matrices. It collects the various partial derivatives of a single function with respect to many variables, and/or of a multivariate function with respect to a single variable, into vectors and matrices that can be treated as single entities.
