Math 270A deals with various aspects of numerical linear algebra, including direct methods for solving systems of equations involving dense and sparse matrices, iterative methods for solving linear systems, and methods for solving eigenvalue problems. I will specify the problem sets each week, and collect the solutions one week later. The assignments will have both theoretical and computational questions. The preferred language of this class (and of numerical linear algebra, in general) is MATLAB®. Homework will be graded, and will represent 50% of your final grade.

The main topics of Numerical Linear Algebra are the solution of different classes of eigenvalue problems and linear systems. For the eigenvalue problem we discuss different classes. (a) The standard eigenvalue problem: For a real or complex matrix  $A \in \mathbb{C}^{n \times n}$ , determine  $x \in \mathbb{C}^n$ ,  $\lambda \in \mathbb{C}$ , such that  $Ax = \lambda x$ :
