In continuation of volumes 8, 9, 22 and 23 of the publisher's series, this new volume comprises 27 chapters dealing with the regeneration of plants from isolated protoplasts and genetic transformation in various species of Actinidia, Allocasuarina, Anthurium, Antirrhinum, Asparagus, Beta, Brassica, Carica, Casuarina, Cyphomandra, Eucalyptus, Ipomoea, Larix, Limonium, Liriodendron, Malus, Musa,...

Plant protoplasts and genetic engineering V.

Isolated protoplasts are a unique tool for genetic manipulation of plants. Since the discovery of a method for the enzymatic isolation of pro- and middle; toplasts by Professor E. C. Cocking in 1960, tremendous progress has been made in this very fascinating area of research. I have witnessed the...

and woody plant protoplasts to use in genetic engineering. Protoplasts were considered essential for gene transfer because the cell wall is usually impermeable to DNA. Several protoplast-based genetic engineering techniques emerged, including protoplast fusion, DNA microinjection, electroporation, and polyethylene glycol (PEG)-mediated

Protoplasts can be used to study membrane biology, including the uptake of macromolecules and viruses. These are also used in somaclonal variation. Protoplasts are widely used for DNA transformation (for making genetically modified organisms), since the cell wall would otherwise block the passage of DNA into the cell.
