Roadmap to the Regents

This book is an introduction to the quantitative treatment of geological problems. It was originally written as a guide for field geologists who wish to quantitatively understand or test their tectonic models. However, the book is an introduction to geodynamics for anyone in the earth sciences. The book provides an understanding of basic concepts of map projections, plate tectonics, heat flow, isostasy, geomorphology, kinematics stress, strain and rheology. In later chapters these concepts are integrated to examine a variety of geodynamic problems: chapter 6 focuses on problems relevant to structural geology, and chapter 7 looks at problems relevant to the field of petrology. In a detailed appendix, a wide range of numerical methods are introduced, such as the finite difference method, Fourier series or the least squares method. Lists of useful

mathematical constants, internet addresses and references are also included in the book.

It is intended for students as well as for developers and researchers in the field. This book is highly useful for faculties and students. One can use this book as a study guide, knowledge test questions bank, practice test kit, quiz book, trivia questions . . . etc. The strategy used in this book is the same as that which mothers and grandmothers have been using for ages to induce kids in the family to sip more soup (or some other nutritious drink). The children are told that some cherries (their favourite noodles or cherries ) are hidden somewhere in the bowl, and that serves as an incentive for drinking the soup. In joint families, by the time the children are old enough to know the trick played by their grandma, there is usually another group of kids ready to fall for it! They excite the kids, but the real nutrition lies not in the noodles but in the soup. The problems given in this book are like those noodles/cherries while solving all these problems are nutritious soup. Now it is your choice to drink the nutritious soups or not!!!.
