Some substances in the group of primary aromatic amines (PAAs) are carcinogenic. PAAs can, for example, occur as contaminants in colour pigments. They can pose a health risk in colour-printed paper napkins and bakery bags as well as other food contact materials if they migrate into food.

Primary aromatic amines from printed food contact ...

The standard describes a procedure to detect EU banned aromatic amines derived from azo colorants in textile fibres, including natural, man-made, regenerated, and blended fibres. The standard is also relevant for all coloured textiles, e.g. dyed, printed, and coated textiles.

Aromatic amine - Wikipedia

For example, primary aromatic amines (PAA) can transfer to foods as impurities of pigments used for printing packaging materials or even paper napkins. Several PAA have carcinogenic and mutagenic properties. If they have contact over longer periods, PAA can transfer to food and then be ingested by humans. stay open.

Frequently Asked Questions about Printing Inks and Primary ...

These limits may be tightened in the future. In a position paper prepared by BfR, the German Federal Institute for Risk Assessment, on aromatic amines migrating from printing inks an individual limit of 2 ppb per specific PAA is recommended in addition to the overall limit of 10 ppb.

What you need to know about primary aromatic amines (PAA)

Polycyclic aromatic amines are organic compounds that consist of an amine substituent (e.g., NH₂ or NO₂) attached to an aromatic structure that consists of two or more rings. Occupational exposure to polycyclic aromatic amines has been associated with the rubber, textile, and dye industries.

Aromatic Amine - an overview | ScienceDirect Topics

Primary Aromatic Amines (PAAs) are a class of compound of which the simplest form is aniline. PAAs are substances that are used, for example, in the production of certain colorants, so-called azo pigments, notably in the color range yellow-orange-red.

Rapid Determination of 33 Primary Aromatic Amines in ...

Primary aromatic amines (PAAs) are substances that can be transferred from food packaging materials into foodstuffs and are "possibly carcinogenic to humans". The formation of PAAs from multilayer packaging materials consisting of aromatic polyurethane (PU) adhesives occurs from the reaction between residual isocyanic monomers that have migrated to the surface of the inner layer of the package and water molecules making contact with the same plastic surface.

On the origin of primary aromatic amines in food packaging ...

10.2788/19565 - Comparability of results is an important feature of the measurements carried out for official controls purposes. In

the area of food contact materials and articles comparability of results is dependent on the availability of samples representative of the consignment, the type of exposure and the test conditions used as well as on the performance of the method of analysis.

Technical guidelines on testing the migration of primary ...

(2020). From pigments to coloured napkins: comparative analyses of primary aromatic amines in cold water extracts of printed tissues by LC-HRMS and LC-MS/MS. Food Additives & Contaminants: Part A: Vol. 37, No. 11, pp. 1985-2010.

From pigments to coloured napkins: comparative analyses of ...

Primary aromatic amines (PAAs) have been broadly studied due to their high toxicity. In this work a method for the analysis of 22 PAAs in aqueous simulants has been developed. The method is based on a solid-phase extraction step using cation-exchange cartridges and the subsequent analysis of the extracts by ultra-high-performance liquid chromatography with mass spectrometric detection.

Quantitative determination of 22 primary aromatic amines ...

Important primary alkyl amines include, methylamine, most amino acids, and the buffering agent tris, while primary aromatic amines include aniline. Secondary (2°) amines —Secondary amines have two organic substituents (alkyl, aryl or both) bound to the nitrogen together with one hydrogen.

Amine - Wikipedia

Primary aromatic amines (PAA) are chemicals present in a wide variety of situations, as they are used in the production of pesticides, pharmaceuticals, explosives, rubber, epoxy polymers, inks (azo).

Primary aromatic amines in food contact plastics | Mé rieux ...

Primary aromatic amines (PAAs) can migrate from packaging into food from different sources such as polyurethanic adhesives used for the manufacture of multilayer films, which may contain residual aromatic isocyanates, or recycled paperboard, because of the presence of azo dyes in the printed paper massively used in the recycling process.

Reliable liquid chromatography mass spectrometry method ...

In aromatic amines, Nitrogen is directly attached to at least one benzene ring. Depending on the number of groups attached to the nitrogen atom, they are categorized as “ primary, ” “ secondary ” and “ tertiary ” amines. “ Aryl amines ” is another name for aromatic amines.

Difference Between Aliphatic and Aromatic Amines | Compare ...

Solution for Which of the following compounds would form Azo-dye from primary aromatic amines? Indicate YES or NO on the boxes provided below. a. b. c. NH₂ CH₃...

For example, primary aromatic amines (PAA) can transfer to foods as impurities of pigments used for printing packaging materials or even paper napkins.
