Projectile Motion Using Runge Kutta

Projectile Motion Using Runge Kutta

To measure error, I am using the code for my dragged-motion simulation with $k = 0$. If you notice that sets acceleration to $[0, -9.81]$, which is ideal projectile motion acceleration. If you notice that sets acceleration to $[0, -9.81]$, which is ideal projectile motion acceleration.

python - Runge-Kutta Simulation For Projectile Motion With ...

i've got to solve numerically the projectile motion equations with the Euler method and the Runge-Kutta 4th order method. Although my codes (Matlab) work, i keep getting exactly the same answers from both of the methods whereas i should get a more accurate answer from the second one.

For comparison with the numerical integration, you can select using the radio buttons either: 1) the Euler technique (also known as the Explicit Euler); 2) the Cromer-Euler (also known as the Implicit Euler); or 3) the Runge-Kutta RK2. When you change the selection, remember to hit the Start button again.

Physics programs: Projectile motion with air resistance . The program can run calculations in one of the following methods: modified Euler, Runge-Kutta 4th order, and Fehlberg fourth-fifth order Runge-Kutta method. To run the code following programs should be included: euler22m.f, rk4_d22.f, rkf45.f.

This means the mass, size of the projectile, and coefficient of drag change with distance. The first part of the assignment asks to just plot the motion given an angle using three functions: stateDeriv, stepRungeKutta, and ivpSolver I have attempted to make a final function dragForce to calculate drag at a given point.
