Magnetocaloric Materials | Annual Review of Materials Research

Recently, the development of a new magnetic refrigeration (MR) technology, based upon the magnetocaloric effect (MCE), has brought an alternative to the conventional gas compression (CGC) technique. The MR technology shows several advantages over the CGC technology. First, the cooling efficiency in magnetic refrigerators is higher (the magnetic cooling efficiency can be reached up to 30 – 60% of a Carnot cycle, whereas it is only 5 – 10% for CGC refrigeration) even at a small scale ...

Review Review of the magnetocaloric effect in manganite ...

Magnetic refrigeration (MR) at room temperature is an emerging technology and shows real potential to enter conventional markets. The principle of MR obeys the magnetocaloric effect (MCE), which is based on the effect caused by a magnetic field on the materials that bear the property of varying the magnetic entropy, as well as its temperature, when varying the magnetic field.

A thorough understanding of the magnetocaloric properties of existing magnetic refrigerant materials has been an important issue in magnetic refrigeration technology. This paper reviews a new class of magnetocaloric material, that is, the ferromagnetic perovskite manganites ($R_{1-x}M_xMnO_3$, where $R=La, Nd, Pr$ and $M=Ca, Sr, Ba$, etc.).

Review of the magnetocaloric effect in manganite materials ...

A detailed discussion of magnetocaloric properties of distinct materials is a vital aspect in magnetic refrigeration technology. This review paper deals with all kinds of magnetocaloric materials such as ferromagnetic perovskites, glass ceramics, oxide-based composites and spinel ferrites. The comparative study of magnetocaloric properties revealed that manganites have the potential applications in magnetorefrigeration technology.

Review on Magnetocaloric Effect and Materials | SpringerLink

Magnetocaloric effect (MCE) is a heating or cooling of a magnetic material when the applied magnetic field changes. At the heart of the MCEs lays coupling between the magnetic moments and external magnetic field, and in some cases the MCE involves structural transitions concomitant with magnetic transitions.

Recent progresses regarding magnetic properties and magnetocaloric effect (MCE) in ternary rare earth RE₂T₂X (RE = Gd-Tm; T = Cu, Ni, Co; and X = Cd, In, Ga, Sn, Al) intermetallic compounds are reviewed in this paper. Some of them exhibit excellent MCE performances which make them attractive in the field of magnetic refrigeration at low temperature.

Review of the magnetocaloric effect in manganite materials

Large magnetocaloric effect in YbPt₂Sn as well as the adiabatic demagnetization refrigeration was reported by Jang et al., 104 where they found the weak magnetic coupling occurred between Yb atoms, that may lead to preventing them from ordering in very low temperature above 0.25 K. This may leave enough entropy free for use in adiabatic demagnetization cooling.
