This research program began in 1993. The idea of developing representative samples of those active in the business creation process, now called nascent entrepreneurs, developed from the success of using regional characteristics to 1 predict variations in new firm birth rates in six countries. The initial purpose was to determine those external factors that encouraged individuals to initiate the business creation process and become, as they are now called, nascent entrepreneurs. The research procedures, mainly the critical aspects of the scre- ing procedures, were developed with the Survey Research Laboratory at the University of Wisconsin in Madison to complete the Wisconsin Entrepreneurial 2 Climate Study. Support for an initial test with a national sample was provided by the Institute for Social Research at the University of Michigan. Richard Curtin became involved with the incorporation of the screening module as part 3 of the Survey of Consumers in October and November in 1993. The success of these efforts in providing a detailed description of the ent- preneurial process based on representative samples led to substantial interest among entrepreneurial scholars. A founding team of Nancy Carter, William Gartner, and Paul Reynolds was able to organize the Entrepreneurial Research Consortium (ERC), a collaborative network of 34 research units that shared the financial cost and sweat equity required to implement the first national project, 4 PSED I.

The digital age has presented an exponential growth in the amount of data available to individuals looking to draw conclusions based on given or collected information across industries. Challenges associated with the analysis, security, sharing, storage, and visualization of large and complex data sets continue to plague data scientists and analysts alike as traditional data processing applications struggle to adequately manage big data. The Handbook of Research on Big Data Storage and Visualization Techniques is a critical scholarly resource that explores big data analytics and technologies and their role in developing a broad understanding of issues pertaining to the use of big data in multidisciplinary fields. Featuring coverage on a broad range of topics, such as architecture patterns, programing systems, and computational energy, this publication is geared towards professionals, researchers, and students seeking current research and application topics on the subject.

In conjunction with top survey researchers around the world and with Nielsen Media Research serving as the corporate sponsor, the Encyclopedia of Survey Research Methods presents state-of-the-art information and methodological examples from the field of survey research. Although there are other "how-to" guides and references texts on survey research, none is as comprehensive as this Encyclopedia, and none presents the material in such a focused and approachable manner. With more than 600 entries, this resource uses a Total Survey Error perspective that considers all aspects of possible survey error from a cost-benefit standpoint.
