Scanning electron microscopy (SEM) images the sample surface by scanning it with a high-energy beam of electrons in a raster scan pattern. The primary electron beam, which is produced under high vacuum, is scanned across the surface of a specimen. When the electrons strike the specimen, a variation of the signal produces an image of the surface, or its elemental composition together with energy dispersive X-rays (EDX).

The Scanning Electron Microscope developed by professor Dr. Charles Oatlev with the assistance of graduate students in the 1950s, are one of the three types of electron microscopes (EM). Electron microscopes utilize the same basic principles as light microscopes , but focus beams of energetic electrons rather than photons, to magnify an object.

**Scanning Electron Microscopy (SEM)**

Scanning electron microscope (SEM), type of electron microscope, designed for directly studying the surfaces of solid objects, that utilizes a beam of focused electrons of relatively low energy as an electron probe that is scanned in a regular manner over the specimen. The electron source and electromagnetic lenses that generate and focus the beam are similar to those described for the ...

**scanning electron microscope | Definition, Images, Uses ...**

Electron microscopy techniques such as scanning electron microscopy (SEM) and TEM are important analytical tools for characterizing the morphology, composition and structure of grown SiNW. Electron microscopy provides a feedback to rationally grow the desired SiNW, with compositional information obtained using energy dispersive X-ray analysis (EDS).

**Electron Microscopy - an overview | ScienceDirect Topics**

Electron beam excitation is used in electron microscopes, scanning electron microscopes (SEM) and scanning transmission electron microscopes (STEM). X-ray beam excitation is used in X-ray fluorescence (XRF) spectrometers. A detector is used to convert X-ray energy into voltage signals; this information is sent to a pulse processor, which measures the signals and passes them onto an analyzer for data display and analysis.

**Energy-dispersive X-ray spectroscopy - Wikipedia**

A scanning electron microscope (SEM) is a type of electron microscope that produces images of a sample by scanning the surface with a focused beam of electrons. The electrons interact with atoms in the sample, producing various signals that contain information about the surface topography and composition of the sample.
