An uncertainty fractional joint probability chance constraint programming is developed to process land use structure optimization under uncertainty. The model integrate uncertainty programming into fractional programming, and the uncertainty programming include interval programming, fuzzy programming, stochastic programming and joint probability chance constraint programming.

Stochastic programming is an approach for modeling optimization problems that involve uncertainty. Whereas deterministic optimization problems are formulated with known pa- rameters, real world problems almost invariably include parameters which are unknown at the time a decision should be made. Stochastic Programming: Optimization When Uncertainty Matters

In the field of mathematical optimization, stochastic programming is a framework for modeling optimization problems that involve uncertainty. Whereas deterministic optimization problems are formulated with known parameters, real world problems almost invariably include some unknown parameters. When the parameters are known only within certain bounds, one approach to tackling such problems is called robust optimization. Here the goal is to find a solution which is feasible for all such data and o

Stochastic programming (Dantzig, 1955) is particular from the point of view of approximation and numerical optimization in that it involves a representation of the objective F by an integral (as soon as F stands for an expected cost under a continuous probability distribution), a large, possibly in fi nite number of dimensions for x, and a large, possibly in fi nite number of constraints for de fi ning the feasibility set C.
