A hip replacement is a common type of surgery where a damaged hip joint is replaced with an artificial one (known as an implant). Adults of any age can be considered for a hip replacement, although most are done on people between the ages of 60 and 80. A modern artificial hip joint is designed to last for at least 15 years.

Hip replacement — NHS — NHS

Hip replacement surgery is an operation used to replace the damaged ball-and-socket with new and durable artificial synthetic parts that mimic the ball-and-socket.

Hip Joint Replacement: Overview, Procedure & Aftercare

Hip arthroscopy: Arthroscopic hip surgery is becoming more common, and the removal of bone spurs can be performed arthroscopically. The advantages of performing an osteoplasty arthroscopically are that it is a minimally invasive surgery, and it allows the surgeon to inspect the hip-joint cartilage.

Hip arthroscopy. Keyhole surgery to treat or investigate damage in the joint. Hip arthroscopy is a popular form of 'keyhole' surgery – so called because it is carried out through a very small incision using special instruments. This makes it less invasive than traditional, 'open' surgery and means you will usually recover more quickly afterwards. It can be used as a diagnostic tool and to treat minor damage in the joint.
