The Bases of Chemical Thermodynamics - CORE

The structure of chemical thermodynamics is based on the first two laws of thermodynamics. Starting from the first and second laws of thermodynamics, four equations called the "fundamental equations of Gibbs" can be derived.

Chemical thermodynamics - Wikipedia

Chemical thermodynamics is based on the general assumptions and conclusions of thermodynamics, above all, on the first and second laws of thermodynamics. The first law and its extremely important corollary—Hess' s law—serve as the basis for thermochemistry.

19.2: Entropy and the Second Law of Thermodynamics Entropy (S) is a state function whose value increases with an increase in the number of available microstates. For a given system, the greater the number of microstates, the higher the entropy. During a spontaneous process, the entropy of the universe increases.

Biological thermodynamics is the quantitative study of the energy transductions that occur in or between living organisms, structures, and cells and of the nature and function of the chemical processes underlying these transductions. Biological thermodynamics may address the question of whether the benefit associated with any particular phenotypic trait is worth the energy investment it requires.

Biological thermodynamics - Wikipedia

Chemical thermodynamics is the study of the interrelation of energy with chemical reactions or with a physical change of state within the confines of the laws of thermodynamics.
