The book will present the progress made since the last meeting in fall 2013 concerning the analysis of circulating extra-cellular nucleic acids. There are a modest number of laboratories involved in this field, nevertheless the number of papers published by researchers is extensive. The articles which will be published in this meeting report will be a valuable contribution for researchers and research students alike and will help them to stay on top of the developments in different research areas and to „ cross borders “ between them.

Despite the development of innovative new analytical techniques for biological trace element research, today's trace element investigators face formidable obstacles to obtaining reliable data. This complete reference identifies and assesses the challenges the analyst encounters at each stage of an analysis, and discusses the effects of various techniques on the sample. Three internationally recognized scientists and authors consider the effects of the numerous collection, storage, and sample preparatory techniques used in sample analysis. Proper analytical quality control, including such critical factors as sampling and sample preparation, specimen preservation and storage, and ashing, is examined. The book also looks at sample preparation methods unique to various instruments and speciation chemistry issues, and examines the link between chemical analysis and specimen banking. A previously unrecognized source of error, presampling factors, is also discussed.
